Minds Matter Philadelphia, Math Session #4 (2021-22)

Algorithmic Problem-Solving [recording]

Saturday Math Tutoring Activities

Dachao⁺ (presenter)

Kathy (co-host)

$$(\pi < \pi^2) \Rightarrow (\pi = 5) ?$$

(Programiz, <https://www.programiz.com/dsa/stack>)

Minds Matter Philadelphia Sophomores

with Class of 2024, Fall 2021

December 4, 2021

10:45-11:30 a.m.

*Correspondence to Ms. Nancy at nancy.olewnik@mindsmatterphilly.org

About Me (Dachao Sun)

Current Graduate Student/Inquirer in Literacy, Reading/Writing Education at the University of Pennsylvania (2021-22)

Computing Science: Computer Graphics, and Image Analysis and Computational Photography Algorithms (2014-18)

Engineering Student in College (pre-2014)

Observation

Ob`serve`: It means to take **notice** of by appropriate conduct; to conform one's action or practice to; to keep; to *heed* (i.e. mind, regard with care) (Webster's 1913 Dictionary)

E.g. The number of footsteps it takes from bedroom to answer a door bell.

Optical Chiasm

(Wikipedia, image from Andreas Vesalius' Fabrica, 1543)

Smallest among {70, 31, 9, 78, 36, 73, 50, 40, 21, 75} ?

Algorithms

(From Wikipedia) The word *algorithm* is derived from the name of the 9th-century Persian mathematician Muḥammad ibn Mūsā al-Khwārizmī, whose *nisba*, an adjective indicating the person's place of origin etc. in Arabic names (identifying him as from Khwarazm) was Latinized as Algoritmi.

An algorithm is a precise rule (or set of rules) specifying **how to solve some problem**; a set of **procedures *guaranteed*** to find the solution to a problem.

(Webster's 1913 Dictionary)

A recipe (a conceptual one) to do some task.

Essential qualifications for a “good” algorithm:

- Always terminates, and produces **correct** results
- **Efficient**: leverage of computational resources
(minimizes running time, memory, network bandwidth..)
- **Simple** to describe, “paraphrase”, and analyze

Data Structures / Two Basic Abstract Data Types

Data structures are the actual **containers of data elements**, a little bit similar to the role of symbolic placeholders in algebra/arithmetic.

Sets/Dictionaryes—an “abstract” data type: one that supports the following operations,

1. Insert;
2. Remove;
3. Find

Arrays: allows retrieval or modification of any element in “ $O(1)$ ” time.

Linked Lists: related questions are in particular popular in job interviews, e.g.

- Insert or delete a node in a linked list
- Reverse a linked list

C++ Programming Syntaxes

main.cpp

```
1 #include <iostream> // preamble: some "libraries" included
2 #include <stdlib.h>
3 //using namespace std;
4
5 int main()
6 {
7     // Declare a variable & specify its value
8     // using the "assignment" ("=") operator
9     int b = 37;
10
11     // "Print" stuff to console
12     std::cout << b << "\n";
13
14     // Explicit declaration of an array (of five integers)
15     int array[5] = {2, 0, 2, 1, 999};
16 }
```

Semi-colons; equality sign as assignment;

“Character OUTput”;

“//” or “/* */” to comment;

Brackets “[.]” can be thought of as a symbolic notation for **indexing**;

Parentheses suggest to call/use an already written modular routine of code, a.k.a. *function*

There is a “terminal” or “console” for results

37

```
...Program finished with exit code 0
Press ENTER to exit console.█
```

Divergence: Implementing a “Data” Problem on Computer

Realization or *implementation* (represent by instance) of a problem could be fun.

We need some data first. How to generate a dozen of (pseudo-)random integers?

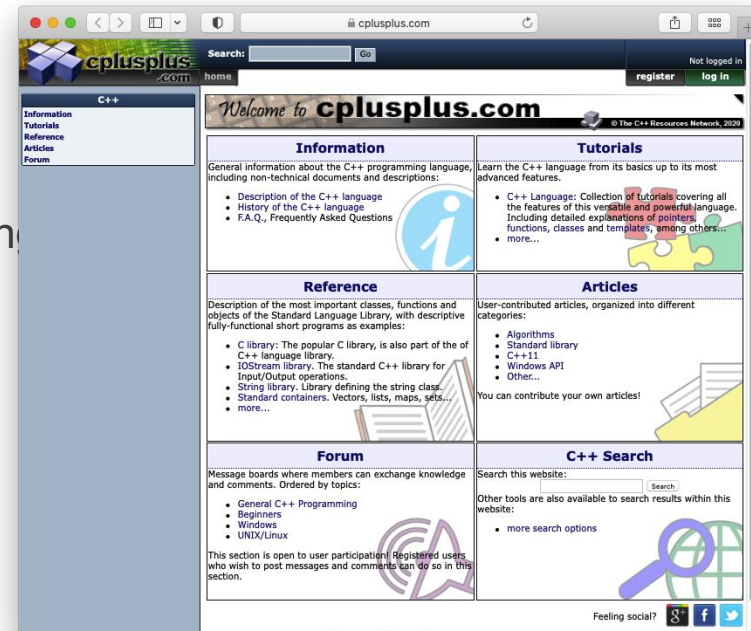

Craft such data idea in programming language C++ (1985-).

- GDB Online (primary): <http://www.onlinegdb.com>
- OneCompiler: <http://onecompiler.com/cpp>
- Programiz: <http://www.programiz.com/cpp-programmin>

Exercise: Try to **make an array** for the following

{83, 86, 77, 15, 93, 35, 86, 92, 49, 21, 62, 27,
90, 59, 63}, i.e. set of 15 integers

And, calculate their **average** and **print it out**.

Sorting and Selection (by rank)

“Have you got everything sorted?”

Thinking about the process of sorting, we probably need to (know how to) **compare** elements of objects, e.g. two integers.

Sorting (a set of objects or a “sequence”, not only numberable but also *comparable*) == to shuffle them around until somehow things are all in ascending (or descending) order in that each element is “smaller” (or “larger”) than the next consecutive one.

Insertion Sort -- Scan the sequence and find-and-put the smallest element at front.

Bubble Sort -- Keep comparing consecutive pairs of elements, swapping the larger one “up” into a smaller-larger pair, all the way up till the end of sequence, and repeat.

Merge Sort -- Break sequence into sub-parts, “recursively” sort each, and merge them together in a way such that the outcome is also sorted (divide and conquer).

QuickSort -- Partition the sequence keyed on a “pivot” element, recursively sort halves

Selection == given a specified “rank” (the position in the ordered sequence), retrieve the corresponding element of data.

Example: Pseudocode Description of “Bubble Sort”

The *pseudocode* of an algorithm is a “plain language” description of the steps in it or another hardware/software system that implements it.

An algorithm of sorting, then, applies on a (generically speaking) sequence by **changing (via shuffling or re-positioning) the orders of elements until they are sorted**, either ascending or descending, such that any **consecutive pairs of elements are all in the increasing** (or all decreasing) **order**.

Question: Is this sequence sorted? {3, 1, 4, 1, 5, 9, 2, ...} Why or why not?

How can I make it “more sorted”?

Proposal - Bubble Sort:

Repeat for n times (where n is the total # of elements):

Iterate through all elements, and at the i -th location:

If element i and element $(i+1)$ were out of order: swap them

std::stable_sort (gcc) - 8950 comparisons, 20268 array accesses, 1.00 ms delay

<http://panthema.net/2013/sound-of-sorting>

What's Next ...

“The Language of Mathematics”: *Counting and measurement* are two different human-cognitive conceptions, upon the formulation of which numbers arose (Devlin, 2012, 4.2). “While logic provides a useful model of mathematical reasoning ... in adopting this broader, societal perspective, I believe this book still help negotiate the transition from high school (to university mathematics) and also anyone develop better reasoning skills.” (Preface)

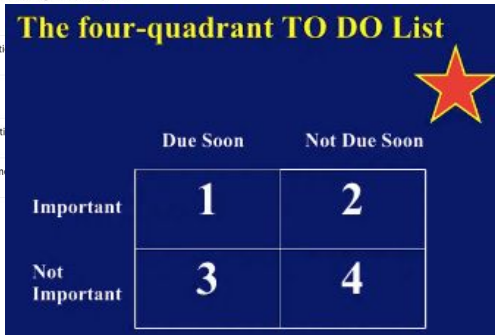

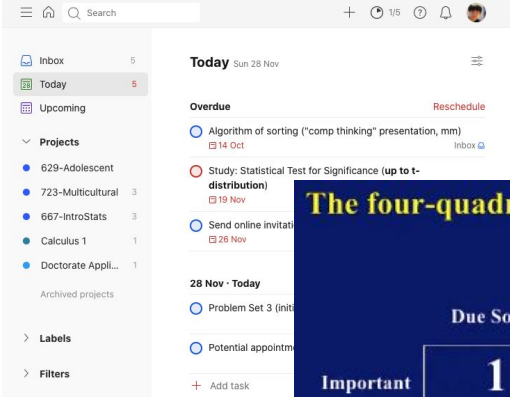

Asymptotic Notations

Models of Computation

Algorithm Design “Philosophical” Paradigms

- Incremental Construction,
- Iterative Refinement,
- Divide and Conquer, and more..

“Time Management”

(Carnegie Mellon, 2008)

- Proposed by American educator Stephen Covey, “The Eisenhower Matrix”
- We can always change the plan, but only if and once you *have* one!
- Try to be on-time; learn to say “No”
- *“Procrastination is the thief of time.”*

Edward Young - Night Thoughts, 1742

Important and Urgent	Important but NOT Urgent
<input type="checkbox"/> Email for questions in course X	<input type="checkbox"/> Problem Set 3 (initial attempt)
<input type="checkbox"/> Synthesis paper abstract (Wed.)	<input type="checkbox"/> Send a few internship applications
<input type="checkbox"/>	<input type="checkbox"/> Tutoring session preparation
<input type="checkbox"/>	<input type="checkbox"/>
NOT Important but Urgent	NOT Important and NOT Urgent
<input type="checkbox"/> Validate carrel and rm reservations	<input type="checkbox"/> Grocery shopping for ingredients
<input type="checkbox"/> “Video of ideas” self-study assign.	<input type="checkbox"/> Read about other grad programs
<input type="checkbox"/> Make additional gym appointments	<input type="checkbox"/> Vacuum bedspace
<input type="checkbox"/> Follow up with literacy instructor	<input type="checkbox"/> Consider visiting arts library
<input type="checkbox"/> Send email to volunteer organization	<input type="checkbox"/> Practice plan for reading strategies
<input type="checkbox"/> Resume cal one course online	<input type="checkbox"/> Wrap up intro stats lecture notes
<input type="checkbox"/> Submit synthesis paper abstract	<input type="checkbox"/> Return a few library books
<input type="checkbox"/> ...	<input type="checkbox"/> Find used bookshelf for apartment
<input type="checkbox"/>	<input type="checkbox"/> Travel plans for winter break
<input type="checkbox"/>	<input type="checkbox"/> ...
<input type="checkbox"/>	<input type="checkbox"/>
<input type="checkbox"/>	<input type="checkbox"/>
